subtraction was performed as previously described
[Bonaldo, Lennon & Soares (1996). Normalization and
Subtraction: Two Approaches TO Facilitate Gene Discovery.
Genome Research 6, 791-806.
Email: cgapbs-r@mail.nih.gov
The sequence contained an oligo-dr track that was present in the
oligonuclectide that was used to prime the synthesis of first
strand cDNA and therefore this may represent a bonafide poly A
tail. cDNA library Preparation: M.B. Soares Lab Clone distribution:

/note="Vector: pDNR-infs, site 1: Sfil (ggccattatggcc);
Site 2: Sfil (ggccgcctcggcc); Double=stranded cDNA was prepared from a pool of 40 cell line polyA+ RNAs (bladder - 2%, blood - 33.4%, brain - 5.6%, breast - 12.5%, colon - 4%, connective tissue - 1.4%, eye - 1%, intestine - 2.6%, kidney - 2.3%, liver - 5.7%, lung - 10.8%, NK-cell - 5.2%, ovary - 4%, pharynx - 2.5%, prostate - 4.3%, salivary gland - 1.3%, and skin - 2.3%). 5' and 3' adaptors were used in cloning as follows:
5'.AAGCAGTGGTATCAAGGAGGAGTGGCCATTACGGCCGGG-3' and 5'.ATTCTAGAGGCGAGGTGCTATTAGGGCCGACATGGTGT(30)NN-3'. Full-length enriched library was constructed using the Clontech creator SMART kit and size-selected to contain the 0.5-1 kb size fraction (other fractions present in NIH MGC_127 and NIH MGC_128). Library created in the laboratory of T. Library."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  211 TATGTAACACCAGGAGACTCAGAAACAGCACCCGTAGTTACTGTGACCCACAGAAATTAT 270

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9
                                                                                                                                                                                                                                                                                                                                                                                        Ή.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Clone distribution: MGC clone distribution information can be four through the I.M.A.G.E. Consortium/LLNL at: http://image.llnl.gov Series: IRAK Plate: 26 Row: o Column: 19
This clone was selected for full length sequencing because it passed the following selection criteria: matched mRNA gi: 4502686.
Location/Qualifiers
                  Strausberg, R.

requests: clonerequest@sanger.ac.uk
On Sep 10, 2001 this sequence version replaced gi:15021284.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.
This sequence was finished as follows unless otherwise noted: all
regions were either double-stranded or sequenced with an alternate
chemistry or covered by high quality data (i.e., phred quality >=
30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by at least
one plasmid subclone or more than one M13 subclone; and the
assembly was confirmed by restriction digest. The following
abbreviations are used to associate primary accession numbers given
in the feature table with their source databases: Em: EMBL; Sw:,
SWISSPROT; Tr:, TREMBL; Wp:, WORNPEP; Information on the WORNPEP
database can be found at
http://www.sanger.ac.uk/Projects/Celegans/wormpep This sequence
was generated from part of bacterial clone contigs of human
chromosome 1. constructed by the Sanger Centre Chromosome 1 Mapping
Group. Further information can be found at
http://www.sanger.ac.uk/PGP/Chr1
RPI1-528G1 is from the library RPCI-11.2 constructed by the group
of Pieter de Jong. For further details see
http://www.chori.org/bacpac/home.htm

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              NOTE: This is a 'working draft' sequence. It currently consists of 11 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     130404 130503: contig of 2434 bp in length

This clone is available from RZPD;
Contact RZPD (customer.service@rzpd.de) for further information.

This CDS clone is part of a collection of human full ORF clones
jointly established and verified by the Harvard Institute of
Proteomics (HIP) and RZPD.

This CDS has been cloned without stopcodon.

The CDS has been inserted into pDONR2Ol via a BP Clonase(TM)

reaction. Additional sequence has been added in front of the start
codon: att. AAAAAA GCA GCT TCC ACC (ATG).

The last codon is followed by the 3' att site: GACCCAGCTTTCTT. att

The clone is validated by full sequence check.

Compared to the reference sequence NM 003874 (GI:4502686) we found
AA exchange(s) at position (first base of changed triplet):

```
This sequence represents a nucleic acid molecule designated Gene 164 from the human cDNA clone HSAWF26 (deposited as clone ATCC 97903 and ATCC 209049) which encodes a secreted human protein. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. AAV59502) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 186 novel genes and their fragments (nucleic acid sequences: AAV5951-V59812; amino acid sequences AAW74731-W75026) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the presence of mutations in the new polynucleotides, by Specific uses are described for each of the 186 polynucleotides, based on which tissues they are most highly expressed in (see AAV59511 for

New isolated human secreted protein for diagnosing, preventing, treating or ameliorating medical conditions and used as a food additive or preservative.

Example 1; SEQ ID NO 174; 129pp; English.

The invention relates to an isolated protein that is one of 186 human secreted proteins, given in the specification, encoded by one of 309 CDNA seguences also given in the specification. The protein is used in a condition in the specification. The protein is used in a condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, crebrovascular disorders e.g. cardiac arrest, crebrovascular disorders infections caused by bacteria, viruses and fungi and ocular disorders (infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. The polypeptides can also be used to alwoound culture of primary tissues, to regenerate tissues and in chemotaxis. The culture of primary tissues, to regenerate tissues and in chemotaxis. The collures an also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. The present sequence represents a cDNA derived from a gene encoding one of the novel human secteted proteins of the invention. Note: This sequence did not form part of the printed specification, but was conditions and the condition of the movel human sected professed to the preservation of the preservation of the preservation of the preservation of the preservation of the printed specification, but was conditions and the conditions of the movel human sected professed to the preservation of the preservation of the preservation of the preservation of the preservation of the preservation of the preservation of the preservation of the preservation of the preservation of the preservation of the preservation of the prese seqdata.uspto.gov/sequence.html?DocID=6420526B1

                                                                                                                                                                                                                                                                                                                                               The present invention relates to the isolation of novel human secreted proteins and the polymucleotide sequences encoding them. The invention also discloses vectors, host cells, antibodies, and recombinant methods for producing human secreted proteins. The polypeptide and polymucleotide sequences for the secreted proteins are useful for preventing, treating, ameliocating or diagnosing medical conditions such as hyperproliferative disorders (e.g. leukaemia or breast cancers), wounds, reproductive disorders (b.g. leukaemia or breast cancers), wounds, reproductive thrombocytopaenia), immunodeficiencies (e.g. haemophilia or thrombocytopaenia), immunodeficiencies (e.g. graft-versus-host disease, thymic hypoplasia), autoimmune disorders (e.g. graft-versus-host disease, wultiple sclerosis or Hashimoco's thyroiditis), allergies (e.g. asthma), viral or bacterial or fungal infections (e.g. ALDS or sepsis), renal disorders (e.g. kidney failure), cardiovascular disorders (e.g. asthma), consorters (e.g. Alzheimer's disease or pectoris, cerebral ischaemia or congenital heart defects), respiratory of alsorders (e.g. and disorders (e.g. disorders), and inflammations (e.g. Crohn's disease). The polymucleotide or polypeptide may also be used as vaccine adjuvants.

ACD82641ACD82950 encode human secreted proteins or their fragments. Or specification, but was obtained in electronic format directly from the consorting and proteins or their fragments.

```

New nucleic acid molecule, useful for preparing a medicament for diagnosing, preventing, treating or ameliorating a medical condition e.g., cancer.

Claim 1; SEQ ID NO 174; 256pp; English.

ø The invention describes an isolated nucleic acid comprising a sequence having 95 % identity with: a polynuclectide fragment of a sequence not given in the specification, or its allelic variant; a polynucleotide fragment of the cDNA sequence; a polynucleotide sequence encoding a polypeptide, or its fragment, domain, epitope or species homologue; or polynucleotide that hybridises under stringent conditions to any one of the sequences of (a)-(c). The nucleic acid is useful for preparing a
